What are decadal climate predictions and how do they differ from climate projections?

Decadal climate predictions

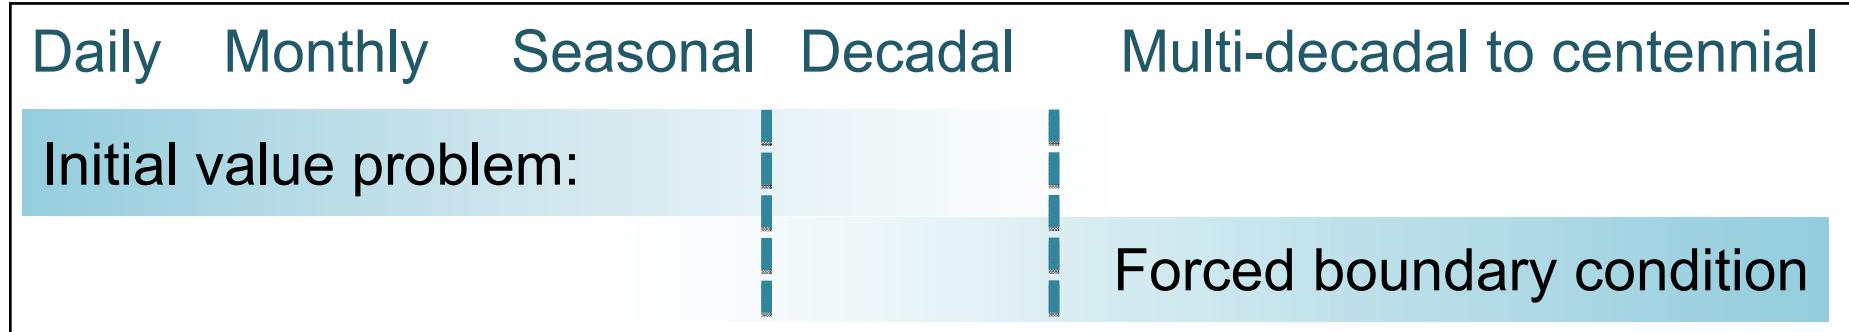

- An estimate of the **actual** future evolution of climate
- Predicts anthropogenic change **and climate variability**
- Initial state based on observations of **slow climate components** (ocean, others)
- **Hindcasts** (retrospective predictions) allow to assess skill

Climate projections

- One **potential** future evolution of climate
- Contingent on emissions scenarios
- Initial state not considered essential

What are decadal climate predictions and how do they differ from climate projections?

Decadal climate predictions - a candidate for climate services?

YES

- time-horizon appropriate for decision making
- indication of predictability for certain quantities
 - Atlantic hurricanes (Smith et al. 2010)
 - Arctic sea ice, heatwaves, impacts?

MiKlip

Decadal climate predictions - a candidate for climate services?

YES

- time-horizon appropriate for decision making
- indication of predictability for certain quantities

RECOMMENDATION

- develop a system for decadal climate predictions (World Summit 2009)
- “Decadal exchange” (lead Hadley Center¹)

Max-Planck-Institut
für Meteorologie

Research challenges

Initialisation

Evaluation

Processes

Regionalisation

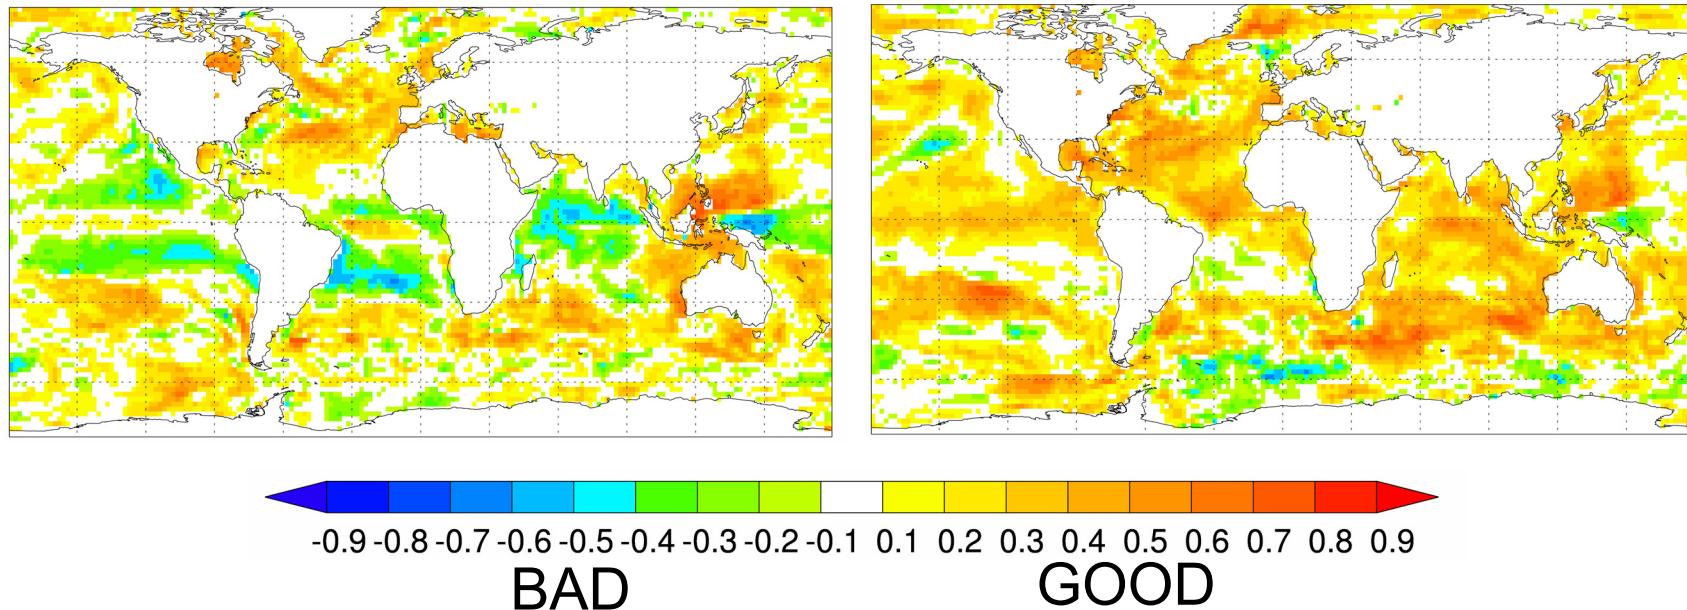

Max-Planck-Institut
für Meteorologie

FONA
Decadal
Climate Prediction
BMBF

MiKlip

Initialisation

Correlation with HadISST for lead year 2

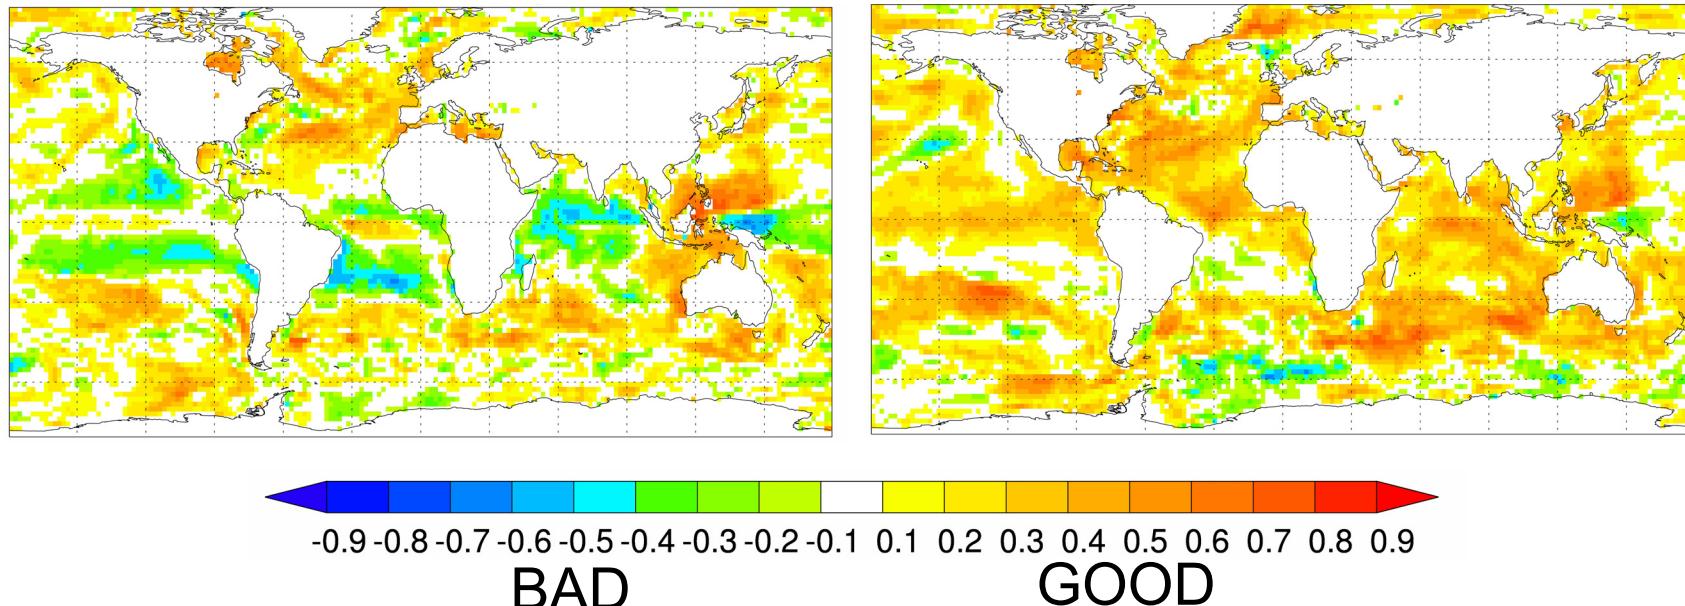

Only difference between hindcasts is the initialisation dataset
Right panel - clear improvement over the tropics

Initialisation

Correlation with HadISST for lead year 2

Only difference between hindcasts is the initialisation dataset
Right panel - clear improvement over the tropics

→ Need: Initialisation techniques and state estimates

Processes

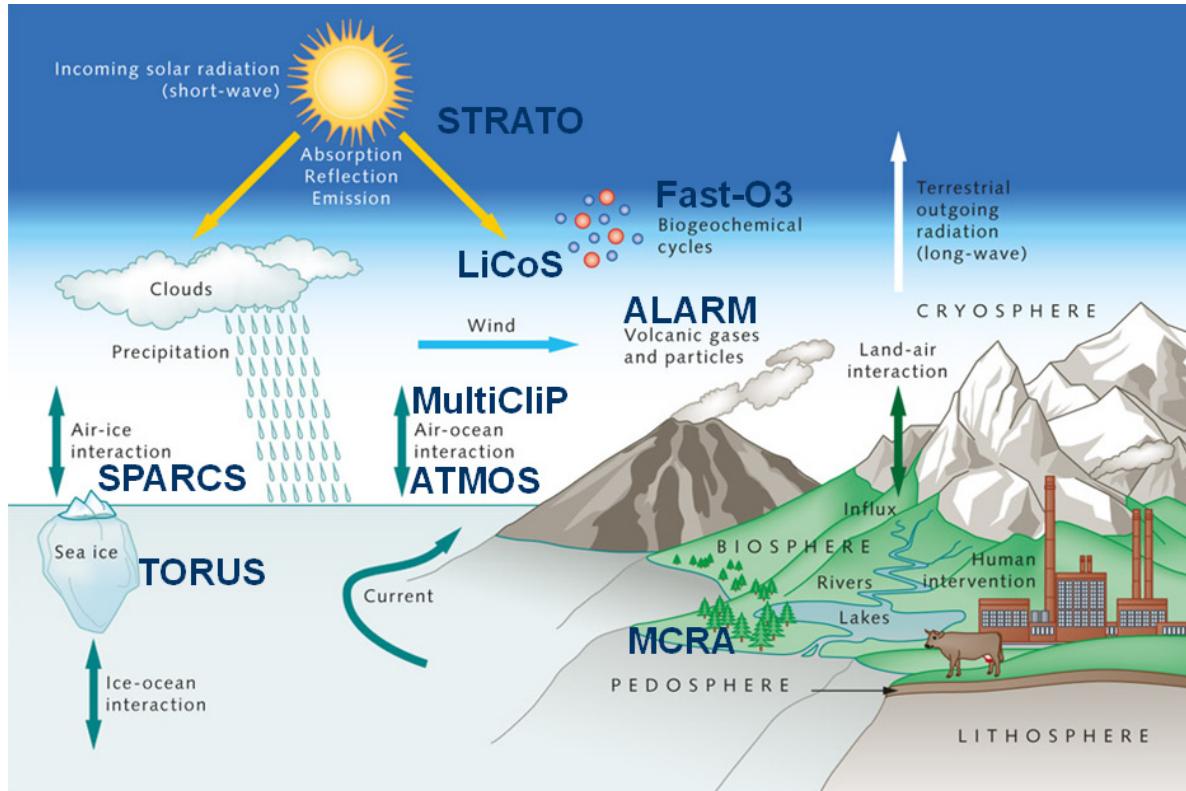

Lack of robust decadal climate variability in global models

- differences in the representation of processes e.g., AMOC
- missing processes

Processes

Lack of robust decadal climate variability in global models

→ Need: increased process understanding

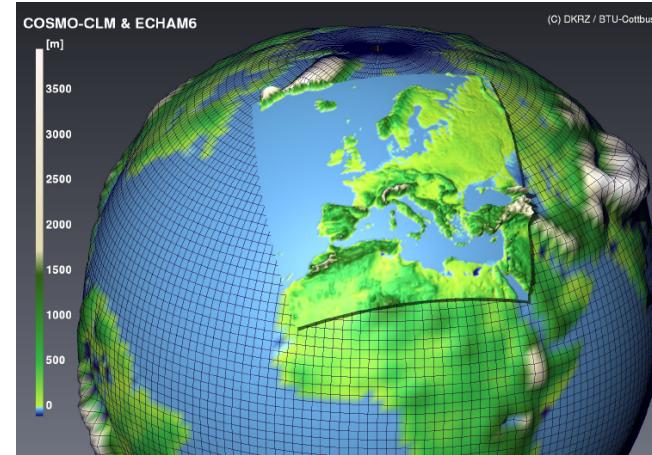

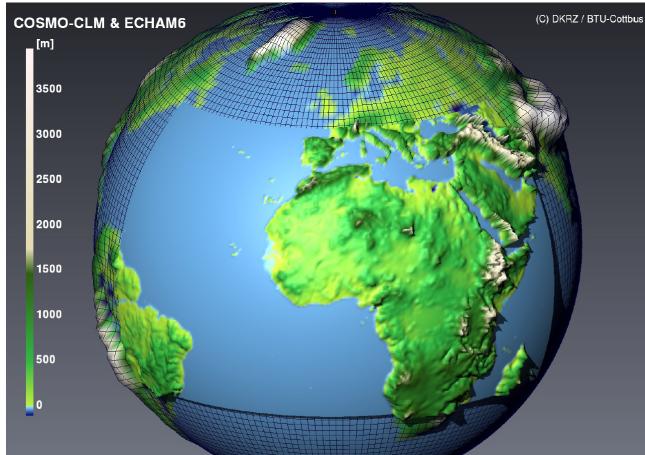

Max-Planck-Institut
für Meteorologie

FONA
Decadal
Climate Prediction
BMBF

MiKlip

Regionalisation

→ Increased relevance for users

But, so far:

- little focus on regional modelling + decadal climate prediction

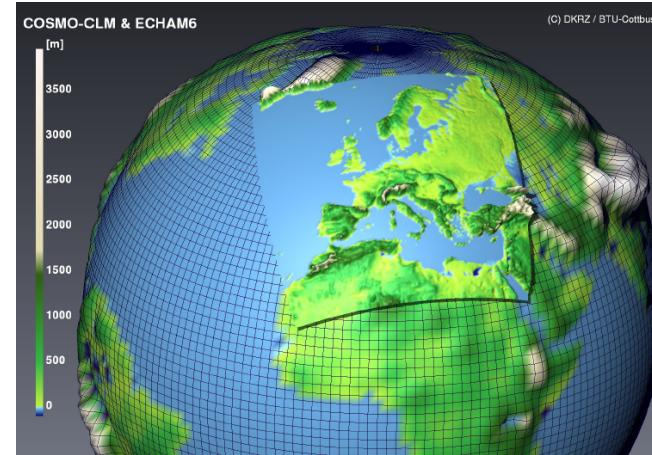

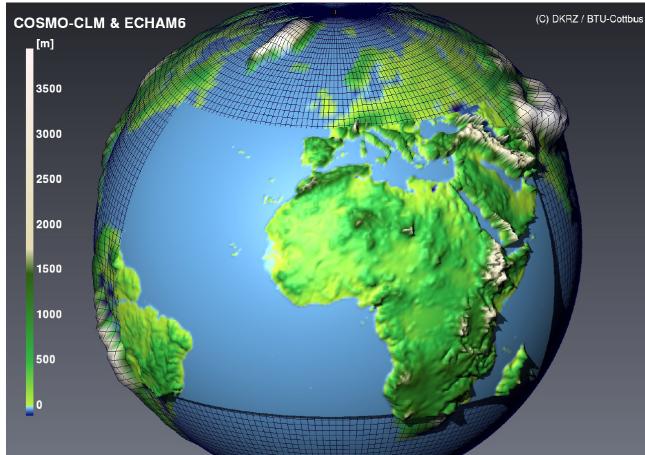

Max-Planck-Institut
für Meteorologie

Graphics from Andreas Will (BTU Cottbus) and DKRZ

FONA
Decadal
Climate Prediction
BMBF

MiKlip

Regionalisation

Little regional modelling + decadal climate prediction

Need to:

- investigate key regions
- combine global and regional models

MiKlip

Evaluation

How do we judge what information is of use?

- Scientific perspective:

- Skill (statistical)

- Societal perspective

- Usefulness /applicability for decision making

Evaluation

How do we judge what information is of use?

- Scientific perspective:

- Skill (statistical)

- Societal perspective

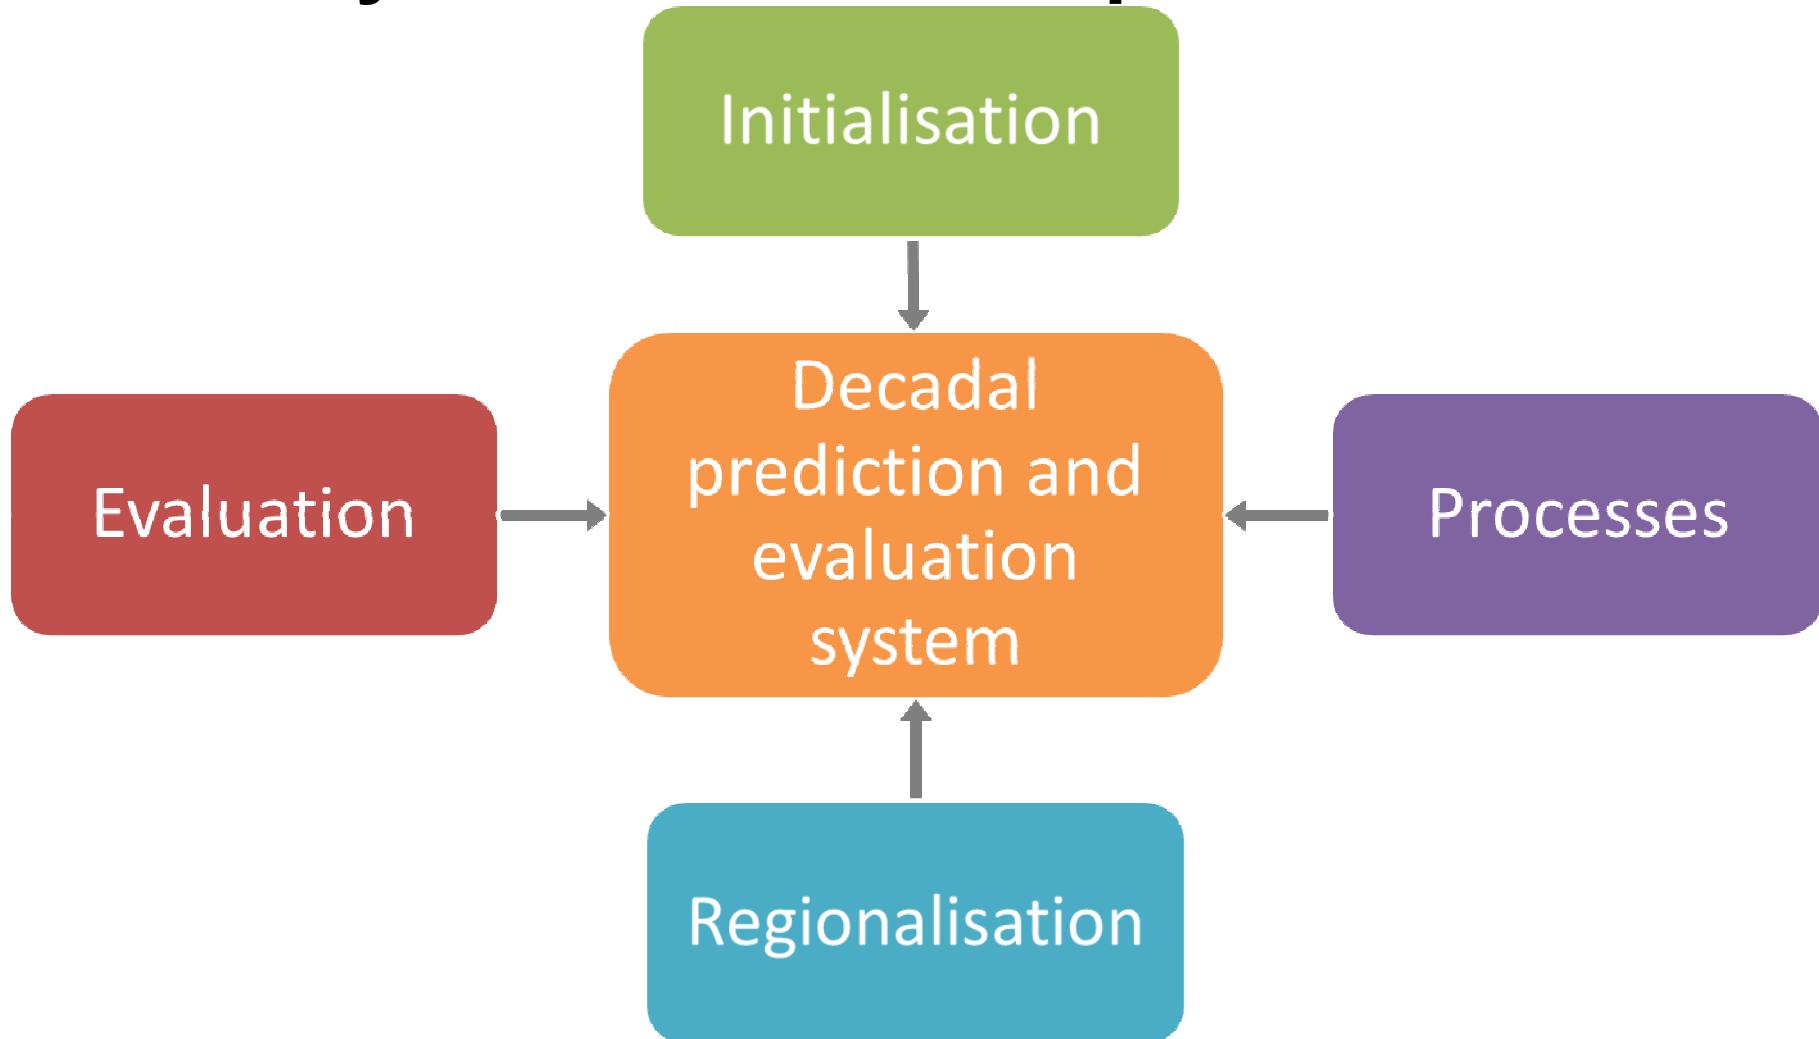

- Usefulness /applicability for decision making

NEED to:

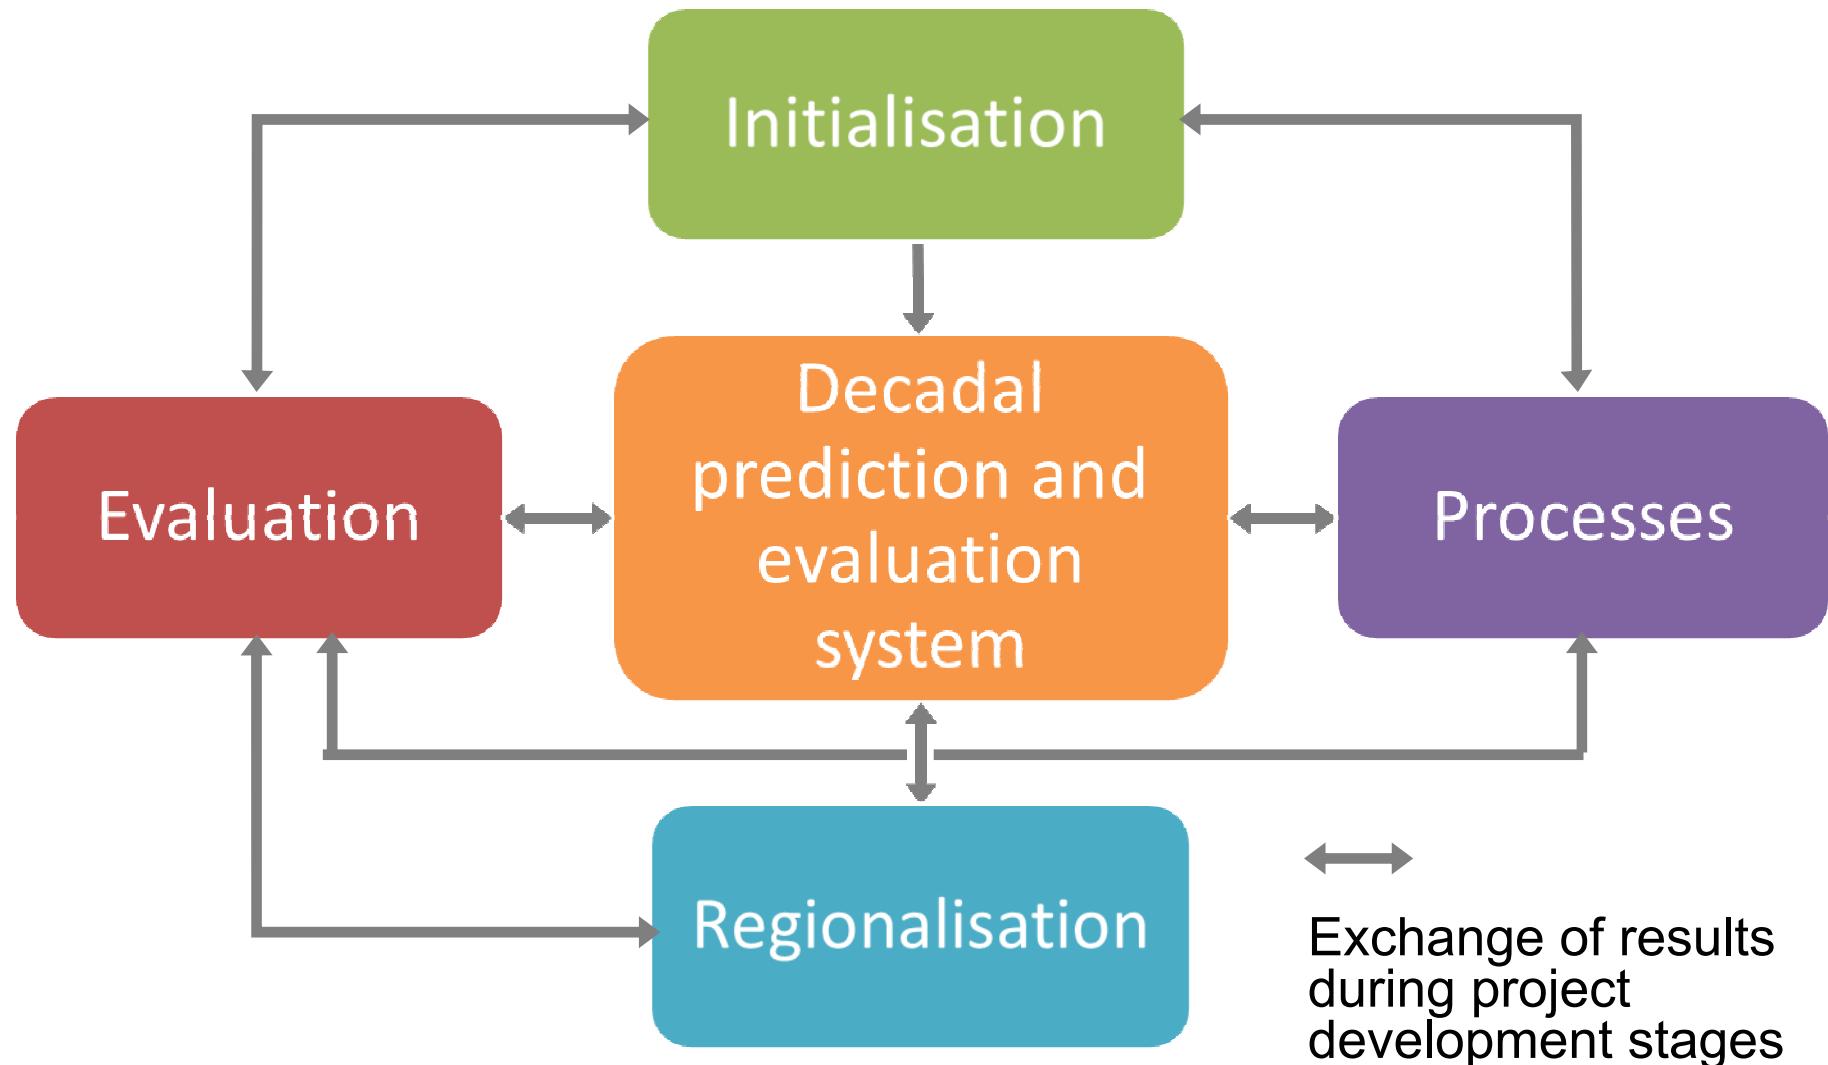

- develop tools and methods to evaluate skill of decadal predictions
- involve potential users

Ultimate challenge: system for decadal prediction

→ MiKlip project aim

A framework for decadal climate prediction
→MiKlip project

Making skillful (and useful) predictions

„Roadmap“ for making decadal climate predictions part of a climate services portfolio

Current decadal prediction system “Baseline 0“

Global model: MPI-ESM-LR

- Historical run: CMIP5 (all forcings)
- Hindcasts: - 1961 – 2011
 - initialised yearly
 - 3 ensemble members (10 for 5th year)

Max-Planck-Institut
für Meteorologie

FONA
Decadal
Climate Prediction
BMBF

MiKlip

Current decadal prediction system “Baseline 0“

Global model: MPI-ESM-LR

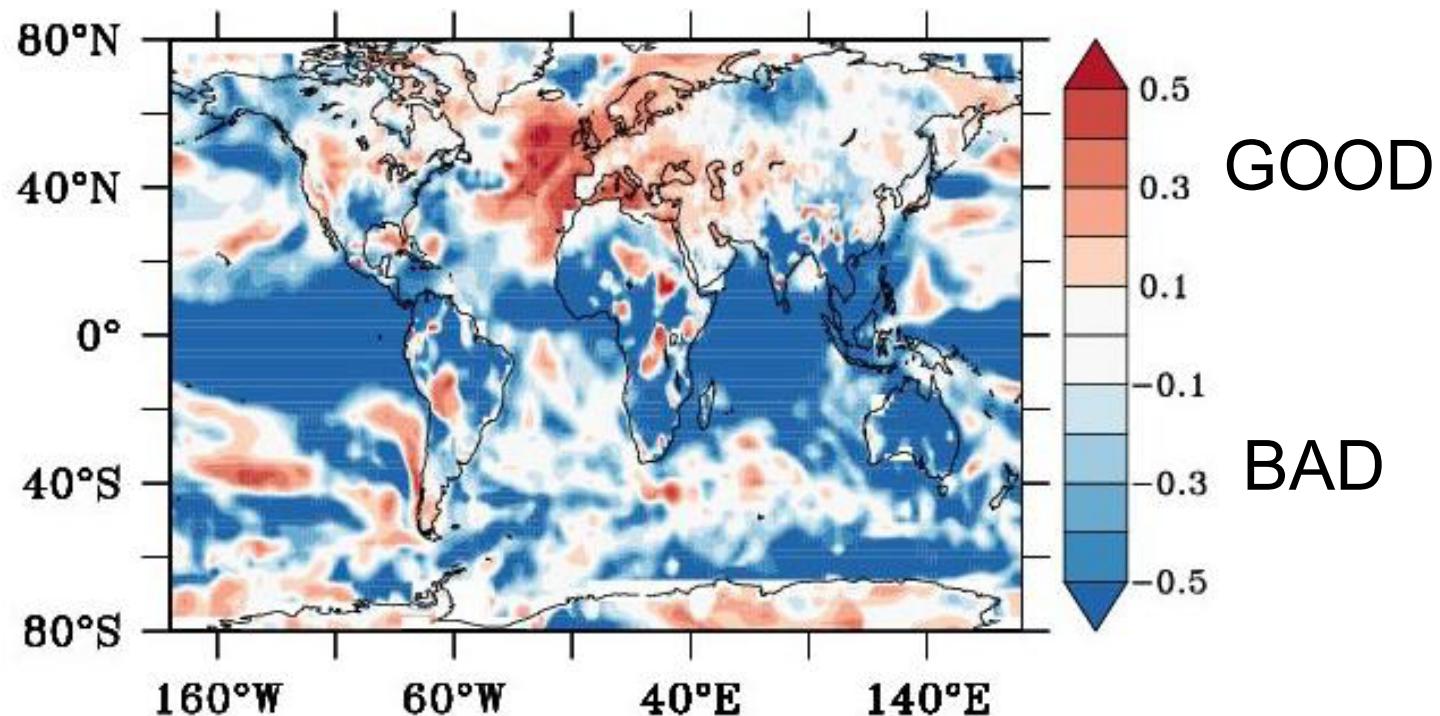

- Historical run: CMIP5 (all forcings)
- Hindcasts: - 1961 – 2011
 - initialised yearly
 - 3 ensemble members (10 for 5th year)

Skill measure for hindcasts

- RMSE compared to
 - historical runs
 - persistence

Initialised experiments compared to historical: skill in North Atlantic, reduced skill in tropics, low skill over land

Global mean surface T – lead year 2-5
RMSE w.r.t. HadISST & GHCN-CAMS

MiKlip

Boosting skill by regionalisation ?

1961-99 summer rainfall trend over N Africa

- Inter-decadal trend more realistic in regional model
→ potential for increasing skill by using regional model
→ contingent on global model skill in SSTs

Max-Planck-Institut
für Meteorologie

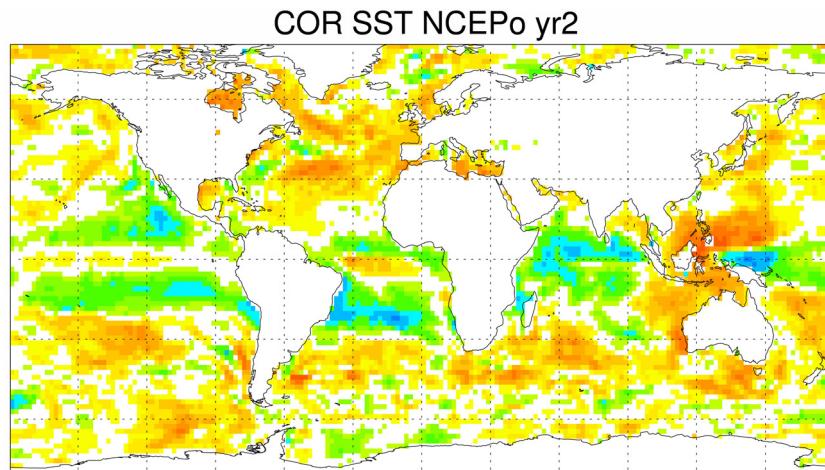

Graphic: Prof. H. Paeth and A. Paxian, Uni Würzburg

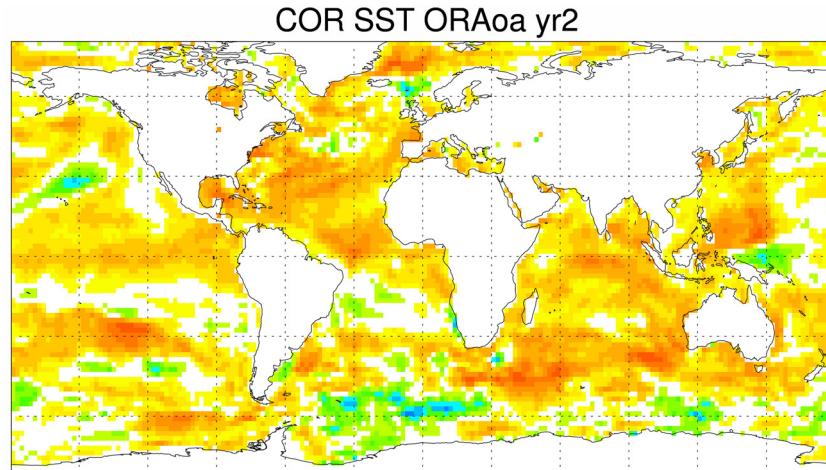

MiKlip

Updating the decadal prediction system

Baseline 0

Baseline 1 (new initialisation)

Baseline 0: decadal trend in Atlantic SST not captured

Baseline 1:

- Positive correlation for the whole Atlantic basin
- SSTs necessary for n. Africa might be better captured
- Highlights the need for several iterations within the project

MiKlip

Skill summary

With the global model:

- robust skill for some regions (e.g. North Atlantic)
- indication of increased skill over land when considering seasons

With the regional models:

- potential for added value, if skill in the global model can be established

Skill summary

With the global model:

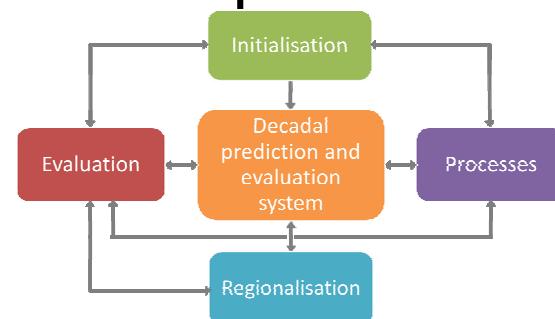

- robust skill for some regions (e.g. North Atlantic)
- indication of increased skill over land when considering seasons

With the regional models:

- potential for added value, if skill in the global model can be established

→ Promising results, but a lot of work before being able to offer a „range“ of regions/times/quantities with skill

→ Need iterations involving all MiKlip modules

A framework for decadal climate prediction
→MiKlip project

Making skillful (and useful) predictions

„Roadmap“ for making decadal climate predictions part of a climate services portfolio

Decadal climate predictions as part of a climate services portfolio

Roadmap

1. Establish confidence in skill before involving users

- Framework for decadal prediction
- Improve system skill (and understanding) from a scientific perspective
- This is where MiKlip (and others) are now

Decadal climate predictions as part of a climate services portfolio

Roadmap

1. Establish confidence in skill before involving users

Once potential for skill has been demonstrated:

2. Involve users in particular regions/with particular quantities of interest

– e.g., useful indices, seasons, quantities

Decadal climate predictions as part of a climate services portfolio

Roadmap

1. Establish confidence in skill before involving users
2. Involve users in particular regions/with particular quantities of interest

When users have been involved

3. Pin-point processes, regions and evaluation tools necessary for users' needs

→ improvement of skill system from a user/climate services perspective

Decadal climate predictions as part of a climate services portfolio

Roadmap

1. Establish confidence in skill before involving users
2. Involve users in particular regions/with particular quantities of interest
3. Pin-point processes, regions and evaluation tools necessary for users' needs
4. Provide decadal predictions for climate services
